

## Frontiers in Macroeconomics Syllabus

**Goal:** This course serves as an introduction into the methods and techniques used in modern macroeconomics. We will begin with basic growth theory models, move onto models of business cycles and conclude with models of money and financial intermediation. Along the way, we will develop some useful modeling tools: dynamic programming, discrete state Markov processes, and solution methods for linear rational expectations business cycle models.

**Professor:** Kevin D. Salyer, University of California, Davis

**Text:** *Advanced Macroeconomics*, David Romer. This works as a reasonable introduction but lacks depth. It is currently in its fourth edition, but if you can find a cheaper first or second edition, that will do. We will supplement this text with journal articles.

**Suggested Texts:** For modern macroeconomics, Ljungqvist and Sargent's text *Recursive Macroeconomic Theory* is probably the best. A recent offering by Dejong and Dave, *Structural Macroeconometrics*, provides a nice empirical perspective on macro research. If you are interested in growth theory, a good, comprehensive treatment can be found in *Economic Growth* by R. Barro and X. Sala-i-Martin. For international macro, the standard text is by M. Obstfeld and K. Rogoff, *Foundations of International Macroeconomics*. Both of these books cover growth theory in more detail than Romer. For monetary policy, I highly recommend the texts by Carl Walsh, *Monetary Theory and Policy* (the second edition is preferred over the first), and Michael Woodford, *Interest and Prices*.

### Daily Schedule

9:00-10:30 First lecture  
10:30-11:00 Coffee break  
11:00-12:30 Second lecture  
12:30-14:00 Lunch  
14:00-15:30 Problem sets  
15:30-16:00 Coffee break  
16:00-17:30 Discussion of problem sets and review  
17:30-19:00 Free time to wind down  
19:00 Dinner

(Please note: we will conclude at 16:00 on Friday to accommodate travel schedules.)

### **Sunday (20.9): Welcome and Overview of the Course**

### **Monday (21.9): Growth: Facts and Theory**

We study the workhorse of modern macroeconomics: the model of growth as first proposed by Solow (and Swan) and then extended by D. Cass and T. Koopmans.

Readings: Chapters 1-3 in Romer.

1. Jones, *The Facts of Economic Growth*
2. Krueger, *Lecture Notes, Chapter 9*.
3. Obstfeld, *Dynamic Optimization in Continuous-Time Economic Models*.

## Tuesday (22.9): Introduction to Stochastic Dynamic Economies

Today we begin our study of modern business cycle models. These are typically discrete time versions of the optimal growth model studied on Monday with one critical addition: uncertainty. To build up the tools necessary to look at models with production, we first study an exchange setting with uncertainty and introduce the dynamic optimization method of dynamic programming. We use this method to examine the behavior of asset prices within the context of the consumption-based capital asset pricing model. We will also discuss the concepts of a *recursive competitive equilibrium*, testing models through calibration, and the celebrated equity premium puzzle.

Readings: Romer, Chapter 7.

4. Lucas, *Methods and Problems in Business Cycle Theory*.
5. Lucas, *Models of Business Cycles* (excerpt).
6. Sargent, *Dynamic Macroeconomic Theory*, Chapter 1.
7. Lucas, Stokey, Prescott, *Recursive Methods in Economic Dynamics*, Chap 2.
8. Handout on dynamic programming.
9. Salyer, Handout on Markov Processes.
10. Salyer, *The Characterization of Savings Under Uncertainty*.
11. Lucas, R.E., Jr., *Asset Prices in an Exchange Economy* (first three sections only).
12. Summers, *The Scientific Illusion in Empirical Macroeconomics*.
13. Mehra and Prescott, *The Equity Premium: A Puzzle*.
14. Rietz, *The Equity Premium: A Solution*.

## Wednesday & Thursday (23-24.9): Consumption Theory and Real Business Cycle Models

After a quick review of the permanent income hypothesis, we begin in earnest our study of modern business cycle theory. The basic model is the stochastic growth model with stochastic shocks to production – this is known as the real business cycle (RBC) model. Since this model has no analytic solution, we must use numerical methods to compute the equilibrium. An overview of the simplest method, linearizing around the steady-state, will be presented. We will discuss some empirical features of business cycles and use these to assess the performance of the RBC model. Our last topic in this section will be a discussion of economies that are driven by self-fulfilling belief shocks.

Readings: Romer, Chapter 4.

15. Hall, *Stochastic Implications of the Life Cycle-Permanent Income Hypothesis*.
16. Cooley, *Frontiers of Business Cycle Research*, Chapter 1.
17. Kydland & Prescott, *Real Facts and a Monetary Myth*.
18. *A User's Guide to Solving Real Business Cycle Models*.
19. Hansen and Wright, *The Labor Market in Real Business Cycle Theory*.
20. Greenwood, Hercowitz and Krusell, *The Role of Investment-Specific Technological Change in the Business Cycle*
21. Salyer, *The Macroeconomics of Self Fulfilling Prophecies: A Review Essay*.

### **Friday (25.9): Monetary Economies; Financial Intermediation**

We conclude the course with an introduction to general equilibrium monetary models. We look at two extensions of the optimal growth model that include a demand for money: (1) A model by M. Sidrauski in which real balances enter the utility function and (2) A model by A. Stockman in which agents face (in addition to the normal budget constraint) a cash-in-advance constraint which states that purchases must be financed out of money holdings. Time permitting, we will then discuss a useful model of financial intermediation.

#### Readings:

22. Sidrauski, *Rational Choice and Patterns of Growth in a Monetary Economy*.
23. Stockman, *Anticipated Inflation and the Capital Stock in a Cash-in-Advance Economy*.
24. Cooley and Hansen, *The Inflation Tax in a Real Business Cycle Model*.
25. Christiano, Eichenbaum, Evans, *Nominal Rigidities and the Dynamic Effects of a Shock to Monetary Policy*.
26. Carlstrom and Fuerst, *Agency Costs, Net Worth, and Business Fluctuations: A Computable General Equilibrium Analysis*.
